

Eliminate Password Risk & Protect Patient Data

Reduce credential risk, phishing exposure, and compliance liability without slowing clinical teams down.

The risks & reality healthcare faces

Healthcare organizations are prime targets for cyberattacks because they hold:

- Protected health information (PHI) and medical records
- Regulatory exposure raises the stakes for access control, auditability, and breach liability.
- Billing, payment, and insurance data
- Highly distributed users, devices, and locations

Today, many healthcare breaches begin with compromised credentials, not sophisticated hacking.

Meet KZero Passwordless

Login Made Simple

Replace passwords with biometric sign-in. Clinicians authenticate using their face or fingerprint on their device, with no passwords to remember or type.

Phishing-Resistant Access

Stop credential theft before it starts. Device-bound authentication prevents phishing, even if users click fake login pages.

One Secure Identity

Access all healthcare applications safely. Sign in once with biometrics and securely access EHR, email, and clinical systems across locations.

Protect Legacy Healthcare Apps

Secure apps that still require passwords. For apps that don't support SSO or passkeys, KZero stores credentials in an encrypted biometric vault.

Why Healthcare Is Moving Beyond Passwords

■ Support Regulatory Compliance

Strengthen access controls for PHI to support requirements such as HIPAA (U.S.), PIPEDA (CA), and PHIPA (ON).

■ Meet Cyber Insurance Requirements

Implement and demonstrate stronger authentication controls insurers look for.

■ Ensure Operational Continuity

Fewer lockouts and password resets and less downtime caused by account compromise.

■ Improve Clinician Productivity

Less time troubleshooting access issues means more time for patient care and fewer workflow interruptions.

How Passwordless Access Works in Your Organization

1

Clinician authenticates with biometrics on their device

Replace passwords with a quick glance or fingerprint scan.

2

Access is bound to trusted devices

Logins cannot be replayed, shared, or phished.

3

KZero securely grants access to applications

Email, clinical apps, and remote access are handled automatically.

**No passwords are typed.
No codes are intercepted.
No secrets are exposed.**

Security That Doesn't Slow Clinical Teams Down

- No additional MFA prompts
- No password resets
- Fast login on office and remote devices
- Works across laptops, desktops, and mobile

Security improves without adding friction to patient care.

Delivered Through Your Trusted IT Provider

No change in who you call for reliable support.

- Implemented and managed by your MSP
- Aligned with your existing IT environment
- Supported and monitored on your behalf
